

# Numerical Relation Extraction from the Web

## MTP Stage 1 Presentation

Aman Madaan    Ashish Mittal

Indian Institute of Technology Bombay, Mumbai

22nd October, 2014

# Outline

- 1 Motivation
- 2 Problem Statement
- 3 Relation Extraction as a Machine Learning Problem
- 4 Distant Supervision
- 5 Distant Supervision Techniques
- 6 TAC Submission
- 7 Numerical Relation Extraction
- 8 Units in Numerical Relation Extraction
- 9 Results

# Motivation

# Motivation

- Repositories of facts containing this information can be found at many places, like data.worldbank.org, Wikipedia infoboxes etc.

# Motivation

- Repositories of facts containing this information can be found at many places, like data.worldbank.org, Wikipedia infoboxes etc.
- Countries are popular and finite, finding complete knowledge bases is possible.

# Motivation

- Repositories of facts containing this information can be found at many places, like data.worldbank.org, Wikipedia infoboxes etc.
- Countries are popular and finite, finding complete knowledge bases is possible.
- What about less popular entities?

# Motivation

- Repositories of facts containing this information can be found at many places, like data.worldbank.org, Wikipedia infoboxes etc.
- Countries are popular and finite, finding complete knowledge bases is possible.
- What about less popular entities?
  - What is the population of Arbit Apartments, Powai?

# Motivation

- Repositories of facts containing this information can be found at many places, like data.worldbank.org, Wikipedia infoboxes etc.
- Countries are popular and finite, finding complete knowledge bases is possible.
- What about less popular entities?
  - What is the population of Arbit Apartments, Powai?
  - What is the GDP of Sugarcane Industry of India?

- Countries are popular and finite, finding complete knowledge bases is possible.
- What about less popular entities?
  - What is the population of Arbit Apartments, Powai?
  - What is the GDP of Sugarcane Industry of India?
  - Percent of Internet users in Mumbai?

# Motivation

- Good News!!!

# Motivation

- Good News!!!
- Web is huge, probably, there is some page which contains the information we are looking for.

# Motivation

- Good News!!!
- Web is huge, probably, there is some page which contains the information we are looking for.
- The way in which you express a fact about an entity depends on the fact, and not the entity.

# Motivation

- Good News!!!
- Web is huge, probably, there is some page which contains the information we are looking for.
- The way in which you express a fact about an entity depends on the fact, and not the entity.
- We may expect the sentence structure to be similar.

# Motivation

- Good News!!!
- Web is huge, probably, there is some page which contains the information we are looking for.
- The way in which you express a fact about an entity depends on the fact, and not the entity.
- We may expect the sentence structure to be similar.
  - Population of India reached 1.3 billion, making it the second largest country in the world.

# Motivation

- The way in which you express a fact about an entity depends on the fact, and not the entity.
- We may expect the sentence structure to be similar.
  - Population of India reached 1.3 billion, making it the second largest country in the world.
  - Population of Arbit Apartments, Powai reached 1300.

# Outline

- 1 Motivation
- 2 Problem Statement
- 3 Relation Extraction as a Machine Learning Problem
- 4 Distant Supervision
- 5 Distant Supervision Techniques
- 6 TAC Submission
- 7 Numerical Relation Extraction
- 8 Units in Numerical Relation Extraction
- 9 Results

# Problem Statement

- Given that we know a lot about countries, can we train extractors that run over the web and pull similar facts about other entities?

# Introduction

- The knowledge is scattered in unstructured text on the web.

According to the [International Monetary Fund](#) (IMF), as of 2013, the Indian economy is nominally worth US\$1.842 trillion; it is the eleventh-largest economy by market exchange rates, and is, at US\$4.962 trillion, the third-largest by [purchasing power parity](#), or PPP.<sup>[9]</sup> With its average annual GDP growth rate of 5.8% over the past two decades, and ready

590.56 million people in China were using  
the internet at mid-2013, an increase of  
nearly 53 million (or 9.85%) from a year earlier.

The land area of the [contiguous United States](#) is 2,959,064 square miles (7,663,941 km<sup>2</sup>). Alaska, separated from the contiguous United States by Canada, is the largest state at 663,268 square miles (1,717,856 km<sup>2</sup>). Hawaii, occupying an archipelago in the central [Pacific](#), southwest of North America, is 10,931 square miles (28,311 km<sup>2</sup>) in area.<sup>[136]</sup>

- Can such facts be extracted automatically?

# Relation Extraction: Problem

- Extract 3-tuples which consists of an entity and a numerical value that are bound by some relation.
  - (India, **economy**, 1.842 trillion USD)
  - (China, **internet users**, 590.56 million)
  - (USA, **land area**, 2,959,054 square mile)

## Relation extraction as a Machine Learning Problem

# Relation Extraction as a Machine Learning Problem

- Structure and content of sentences expressing the same relations can be expected to be similar.
  - The population of Australia is estimated to be 23,622,400 as of 7 October 2014.
  - According to an official estimate for 1 June 2014, the population of Russia is 143,800,000.

# Relation Extraction as a Machine Learning Problem

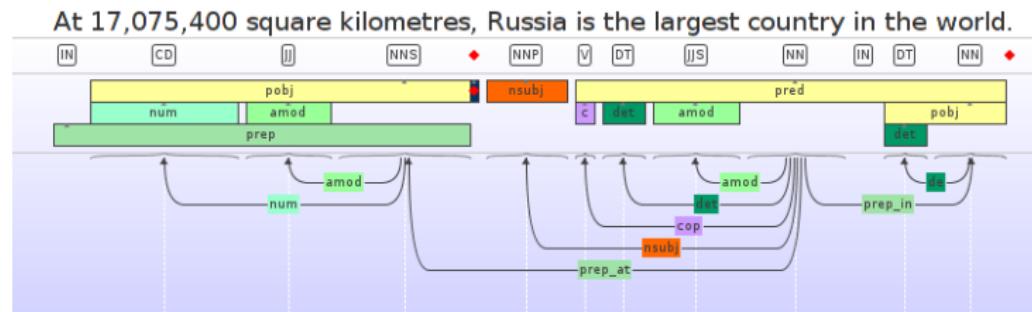

- Structure and content of sentences expressing the same relations can be expected to be similar.
  - At 17,075,400 square kilometres, Russia is the largest country in the world.
  - With an area of 504,030  $km^2$ , Spain is the second largest country in Western Europe.

# Relation Extraction as a Machine Learning Problem

- Redundancy in grammatical features and dependencies of the sentences expressing same relation.

# Relation Extraction as a Machine Learning Problem

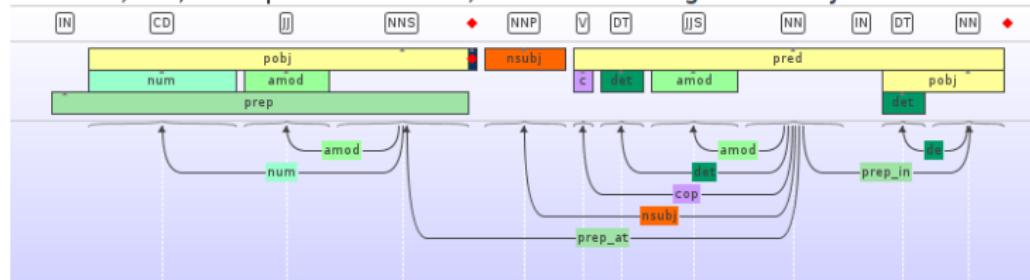

- Redundancy in grammatical features and dependencies of the sentences expressing same relation.

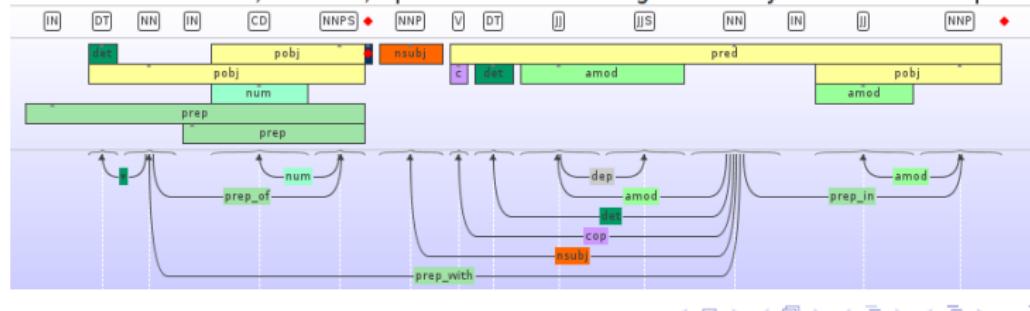

# Relation Extraction as a Machine Learning Problem

- Redundancy in grammatical features and dependencies of the sentences expressing same relation.

At 17,075,400 square kilometres, Russia is the largest country in the world.

With an area of 504,030 km<sup>2</sup>, Spain is the second largest country in Western Europe.

# Relation Extraction as a Machine Learning Problem

- There is lot of redundancy in ways in which a relation is expressed in sentence.

# Relation Extraction as a Machine Learning Problem

- There is lot of redundancy in ways in which a relation is expressed in sentence.
- So for every relation learn the patterns that express it.

# Relation Extraction as a Machine Learning Problem

- There is lot of redundancy in ways in which a relation is expressed in sentence.
- So for every relation learn the patterns that express it.
  - grammatical patterns - POS tags, dependency parse.

# Relation Extraction as a Machine Learning Problem

- There is lot of redundancy in ways in which a relation is expressed in sentence.
- So for every relation learn the patterns that express it.
  - grammatical patterns - POS tags, dependency parse.
  - keywords for the relations.

# Relation Extraction as a Machine Learning Problem

- There is lot of redundancy in ways in which a relation is expressed in sentence.
- So for every relation learn the patterns that express it.
  - grammatical patterns - POS tags, dependency parse.
  - keywords for the relations.
- This forms the relation extraction as a multi-class classification problem.

# Possible Workflow

## Possible Workflow

- Collect enough examples for each relation so that there are sufficient patterns and enough redundancy to exploit.

## Possible Workflow

- Collect enough examples for each relation so that there are sufficient patterns and enough redundancy to exploit.
- Extract features (important keywords, grammatical structure, parse trees, etc.) for these sentences.

## Possible Workflow

- Collect enough examples for each relation so that there are sufficient patterns and enough redundancy to exploit.
- Extract features (important keywords, grammatical structure, parse trees, etc.) for these sentences.
- Learn a multi-class classifier on this training data (Explained later).

## Possible Workflow

- Collect enough examples for each relation so that there are sufficient patterns and enough redundancy to exploit.
- Extract features (important keywords, grammatical structure, parse trees, etc.) for these sentences.
- Learn a multi-class classifier on this training data (Explained later).
- Once the model is learnt, for every sentence

# Possible Workflow

- Collect enough examples for each relation so that there are sufficient patterns and enough redundancy to exploit.
- Extract features (important keywords, grammatical structure, parse trees, etc.) for these sentences.
- Learn a multi-class classifier on this training data (Explained later).
- Once the model is learnt, for every sentence
  - Extract features for the sentence

# Possible Workflow

- Collect enough examples for each relation so that there are sufficient patterns and enough redundancy to exploit.
- Extract features (important keywords, grammatical structure, parse trees, etc.) for these sentences.
- Learn a multi-class classifier on this training data (Explained later).
- Once the model is learnt, for every sentence
  - Extract features for the sentence
  - Predict the relation using the model for these features

## Possible Workflow

- Collect enough examples for each relation so that there are sufficient patterns and enough redundancy to exploit.
- Extract features (important keywords, grammatical structure, parse trees, etc.) for these sentences.
- Learn a multi-class classifier on this training data (Explained later).
- Once the model is learnt, for every sentence
  - Extract features for the sentence
  - Predict the relation using the model for these features
  - store the fact into database.

# Challenge

- The size of corpus is enormous (e.g, 5 million sentences).

# Challenge

- The size of corpus is enormous (e.g, 5 million sentences).
- It is very hard to go through the entire corpus and label each sentence to one of the relations.

# Challenge

- The size of corpus is enormous (e.g, 5 million sentences).
- It is very hard to go through the entire corpus and label each sentence to one of the relations.
- For model to generalize well, we need lot of training data.

# Challenge

- The size of corpus is enormous (e.g, 5 million sentences).
- It is very hard to go through the entire corpus and label each sentence to one of the relations.
- For model to generalize well, we need lot of training data.
- What to do then?

# Outline

# Distant Supervision

# Distant Supervision

- Manual labeling of the entire corpus is not possible

# Distant Supervision

- Manual labeling of the entire corpus is not possible
- Weak Supervision as a middle ground

# Distant Supervision

- Manual labeling of the entire corpus is not possible
- Weak Supervision as a middle ground
- Use Heuristics to align a table of facts with the corpus

# Distant Supervision

- Manual labeling of the entire corpus is not possible
- Weak Supervision as a middle ground
- Use Heuristics to align a table of facts with the corpus
- Fuzzy training

# Distant Supervision

## Example

- Born - In database

Donald Knuth	Wisconsin
Srinivasa Ramanujan	Erode
Alan Turing	London

- Given Sentences

- Srinivasa Ramanujan was born in his maternal grandmother's home in Erode.
- Srinivasa Ramanujan was born in Erode, Tamilnadu, India, on 22nd December, 1887.
- Turing was born in Paddington, London, while his father was on leave from his position with the Indian Civil Service (ICS) at Chhatrapur, Bihar
- Alan Turing biopic The Imitation Game named as London film festival opener.

# Distant Supervision

## Example

- Born - In database

Donald Knuth	Wisconsin
Srinivasa Ramanujan	Erode
Alan Turing	London

- Given Sentences

- Srinivasa Ramanujan was born in his maternal grandmother's home in Erode. LABEL : BornIn
- Srinivasa Ramanujan was born in Erode, Tamilnadu, India, on 22nd December, 1887.
- Turing was born in Paddington, London, while his father was on leave from his position with the Indian Civil Service (ICS) at Chhatrapur, Bihar
- Alan Turing biopic The Imitation Game named as London film festival opener.

# Distant Supervision

# Distant Supervision

- Distant supervision assumption, any sentence containing the entity pair will express the corresponding relation

# Distant Supervision

- Distant supervision assumption, any sentence containing the entity pair will express the corresponding relation
- Can quickly label huge corpora

# Distant Supervision

- Distant supervision assumption, any sentence containing the entity pair will express the corresponding relation
- Can quickly label huge corpora
- Same entity pair can match different relations (Founded(Steve Jobs, Apple) or CEO(Steve Jobs, Apple))

# Distant Supervision

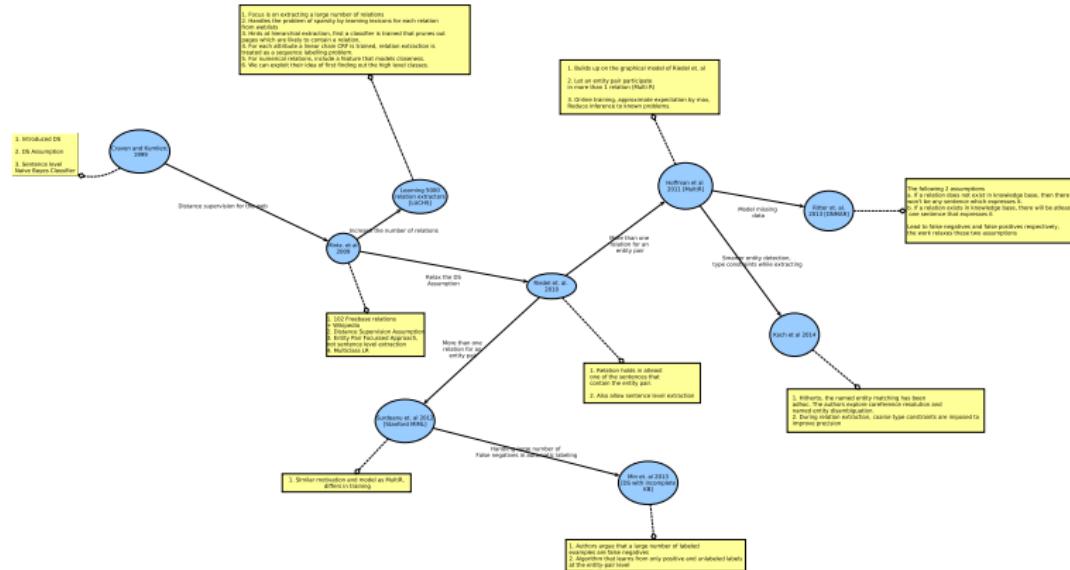

- Distant supervision assumption, any sentence containing the entity pair will express the corresponding relation
- Can quickly label huge corpora
- Same entity pair can match different relations (Founded(Steve Jobs, Apple) or CEO(Steve Jobs, Apple))
- False positives, may lead to model learning wrong patterns for relations

# Outline

- 8 Units in Numerical Relation Extraction
- 9 Results

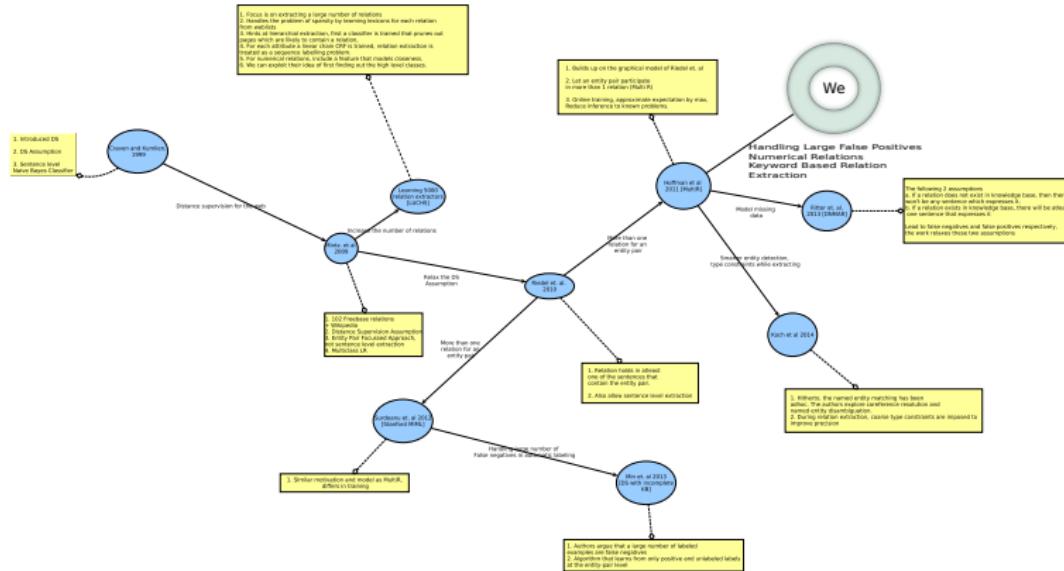

# Distant Supervision Techniques

- First paper in 1999, almost every possibility explored

# Distant Supervision Techniques

- First paper in 1999, *almost* every possibility explored

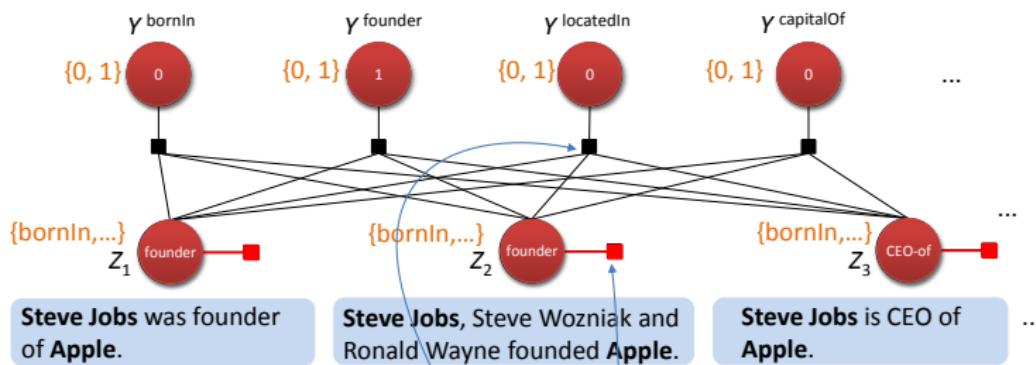

# Relation Extraction Using MultiR

From raphaelhoffmann.com/publications

## Model

Steve Jobs, Apple:

$$p(\mathbf{Y} = \mathbf{y}, \mathbf{Z} = \mathbf{z} | \mathbf{x}; \theta) \stackrel{\text{def}}{=} \frac{1}{Z_x} \prod_r \Phi^{\text{join}}(y^r, z) \prod_i \Phi^{\text{extract}}(z_i, x_i)$$

$$\Phi^{\text{join}}(y^r, z) \stackrel{\text{def}}{=} \begin{cases} 1 & \text{if } y^r = \text{true} \wedge \exists i : z_i = r \\ 0 & \text{otherwise} \end{cases}$$

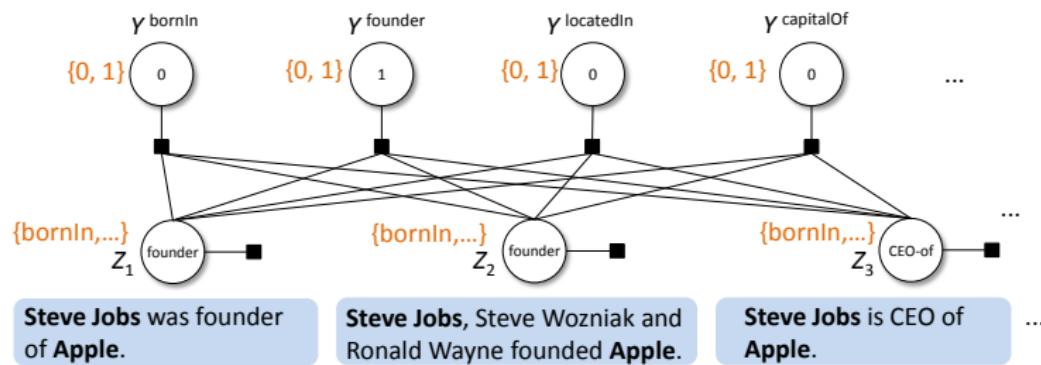

All features at  
sentence-level

(join factors are  
deterministic ORs)

# Relation Extraction Using MultiR

From raphaelhoffmann.com/publications

## Model

- Extraction almost entirely driven by sentence-level reasoning
- Tying of facts  $Y_r$  and sentence-level extractions  $Z_i$  still allows us to model weak supervision for training

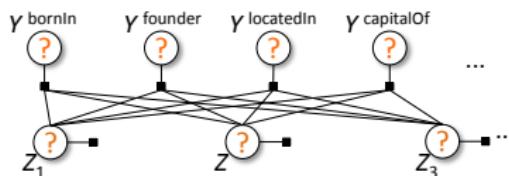

# Relation Extraction Using MultiR

From raphaelhoffmann.com/publications

## Inference

Need:

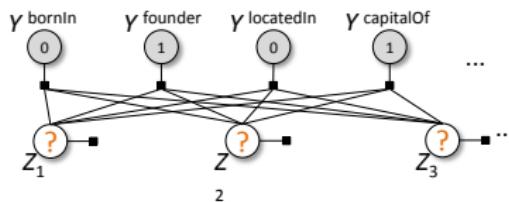

- Most likely sentence labels:

$$\arg \max_{\mathbf{y}, \mathbf{z}} p(\mathbf{y}, \mathbf{z} | \mathbf{x}; \theta)$$

Easy

- Most likely sentence labels *given facts*:

$$\arg \max_{\mathbf{z}} p(\mathbf{z} | \mathbf{x}, \mathbf{y}; \theta)$$

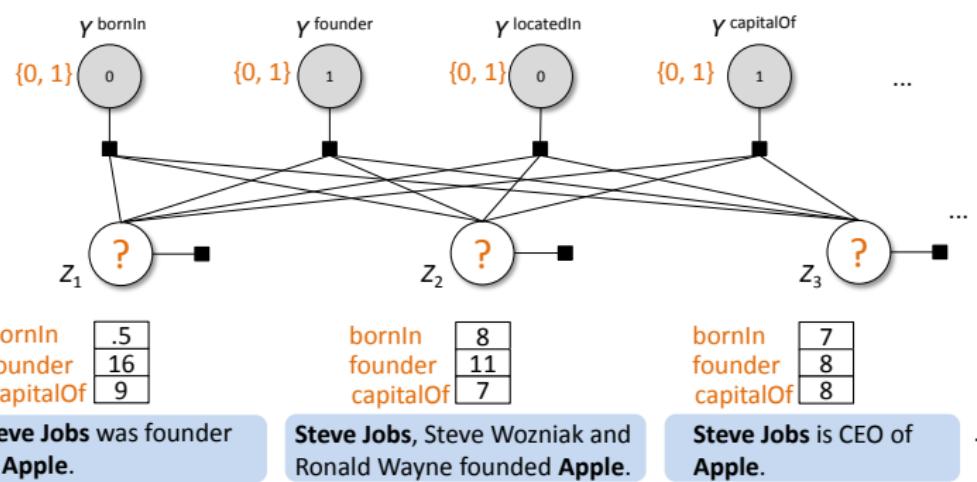

Challenging

# Relation Extraction Using MultiR

From raphaelhoffmann.com/publications

## Inference

- Computing  $\arg \max_z p(z|x, y; \theta)$ :

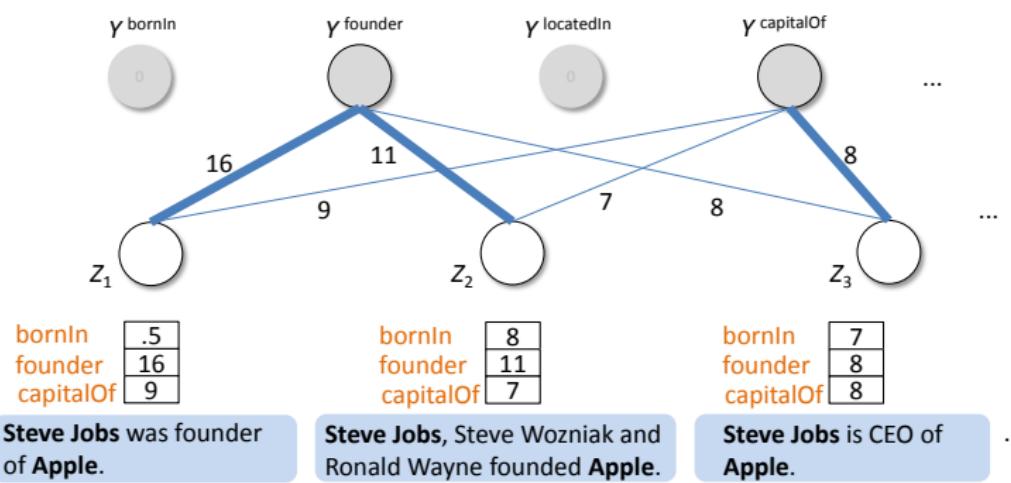

# Relation Extraction Using MultiR

From raphaelhoffmann.com/publications

## Inference

- Variant of the weighted, edge-cover problem:

# Relation Extraction Using MultiR

From raphaelhoffmann.com/publications

## Learning

- Training set  $\{(\mathbf{x}_i, \mathbf{y}_i) | i = 1 \dots n\}$ , where
  - $i$  corresponds to a particular entity pair
  - $\mathbf{x}_i$  contains all sentences with mentions of pair
  - $\mathbf{y}_i$  bit vector of facts about pair from database
- Maximize Likelihood

$$O(\theta) = \prod_i p(\mathbf{y}_i | \mathbf{x}_i; \theta) = \prod_i \sum_{\mathbf{z}} p(\mathbf{y}_i, \mathbf{z} | \mathbf{x}_i; \theta)$$

# Relation Extraction Using MultiR

From raphaelhoffmann.com/publications

## Learning

- Scalability: Perceptron-style additive updates
- Requires two approximations:
  1. Online learning  
For example i (entity pair), define

$$\phi(\mathbf{x}, \mathbf{z}) = \sum_j \phi(x_j, z_j)$$

Use gradient of local log likelihood for example i:

$$\begin{aligned}\frac{\partial \log O_i(\theta)}{\partial \theta_j} &= E_{p(\mathbf{z}|\mathbf{x}_i, \mathbf{y}_i; \theta)} [\phi_j(\mathbf{x}_i, \mathbf{z})] \\ &\quad - E_{p(\mathbf{y}, \mathbf{z}|\mathbf{x}_i; \theta)} [\phi_j(\mathbf{x}_i, \mathbf{z})]\end{aligned}$$

2. Replace expectations with maximizations

# Relation Extraction Using MultiR

From raphaelhoffmann.com/publications

## Learning: Hidden-Variable Perceptron

passes over  
dataset

for each  
entity pair  $i$

most likely  
sentence labels  
and inferred facts  
(ignoring DB facts)

most likely  
sentence labels  
given DB facts

```
initialize parameter vector  $\Theta \leftarrow 0$ 
for  $t = 1 \dots T$  do
    for  $i = 1 \dots n$  do
         $(\mathbf{y}', \mathbf{z}') \leftarrow \arg \max_{\mathbf{y}, \mathbf{z}} p(\mathbf{y}, \mathbf{z} | \mathbf{x}_i; \theta)$ 
        if  $\mathbf{y}' \neq \mathbf{y}_i$  then
             $\mathbf{z}^* \leftarrow \arg \max_{\mathbf{z}} p(\mathbf{z} | \mathbf{x}_i, \mathbf{y}_i; \theta)$ 
             $\Theta \leftarrow \Theta + \phi(\mathbf{x}_i, \mathbf{z}^*) - \phi(\mathbf{x}_i, \mathbf{z}')$ 
        end if
    end for
end for
Return  $\Theta$ 
```

## Cold Start Knowledge Base Population, 2014

- Knowledge Base Population (KBP) track of TAC encourages the development of systems that can match entities mentioned in natural texts with those appearing in a knowledge base and extract novel information about entities from a document collection and add it to a new or existing knowledge base.

## Cold Start Knowledge Base Population, 2014

- Knowledge Base Population (KBP) track of TAC encourages the development of systems that can match entities mentioned in natural texts with those appearing in a knowledge base and extract novel information about entities from a document collection and add it to a new or existing knowledge base.
- Some example relations:
  - children of
  - city of birth
  - shareholders
  - countries of residence

## Cold Start Knowledge Base Population

- Modeled the problem using distant supervision.
- Used Freebase as an existing Knowledge base.
- **Freebase:** Freebase is a large collaborative knowledge base consisting of metadata composed mainly by its community members.
- It is an online collection of structured data harvested from many sources, including individual, user-submitted wiki contributions.

# Corpus

- The TAC corpus consisted of three type of documents:

# Corpus

- The TAC corpus consisted of three type of documents:
  - **discussion forums** 99,063 English discussion forum documents selected from the BOLT Phase 1 discussion forums source data releases. Each forum includes at least 5 posts.

- The TAC corpus consisted of three type of documents:
  - **discussion forums** 99,063 English discussion forum documents selected from the BOLT Phase 1 discussion forums source data releases. Each forum includes at least 5 posts.
  - **newswire** 1,000,257 documents selected from English Gigaword Fifth Edition.

# Corpus

- Subset of the tac corpus
- 268, 036 Documents, X sentences having a country and a number
- List of countries augmented manually by adding all possible synonyms (Dutch, Netherlands) and inflections (Ireland, Irish)

# Distant supervision process for numerical relation extraction

- Extract a country and number from a sentence, go to kb and check if there is a match.
- Can be creative during matching:
  - Distance based matching
  - Time based matching

# First Attempt: Vanilla Matching

# Vanilla Matching

- A large number of matches
- Most of them false positives

# Vanilla Matching: Results

Relation	Total Matches	Sampled Matches	True Matches	Precision

# False Positives

Numbers are weak entities

- Vanilla numerical relation matching is bound to attract humoungous amounts of false positives;

# False Positives

Numbers are weak entities

- Vanilla numerical relation matching is bound to attract humoungous amounts of false positives;
- Stems from the fact that numbers don't have an identity of their own.

# False Positives

Numbers are weak entities

- Vanilla numerical relation matching is bound to attract humoungous amounts of false positives;
- Stems from the fact that numbers don't have an identity of their own.
- Consider India and Mumbai Vs. India and 19

# False Positives

Numbers are weak entities

- Vanilla numerical relation matching is bound to attract humoungous amounts of false positives;
- Stems from the fact that numbers don't have an identity of their own.
- Consider India and Mumbai Vs. India and 19
- Mumbai is a strong entity, 19 is a **weak** entity.

# False Positives

Numbers are weak entities

- Compare the number of sentences in which India and Mumbai appear together, vs the number of sentences in which India and 19 appear together.

# False Positives

Numbers are weak entities

- Compare the number of sentences in which India and Mumbai appear together, vs the number of sentences in which India and 19 appear together.
- Just 19 can appear with India in several contexts:

# False Positives

Numbers are weak entities

- Compare the number of sentences in which India and Mumbai appear together, vs the number of sentences in which India and 19 appear together.
- Just 19 can be appear with India in several contexts:
  - Internet user %

# False Positives

Numbers are weak entities

- Compare the number of sentences in which India and Mumbai appear together, vs the number of sentences in which India and 19 appear together.
- Just 19 can be appear with India in several contexts:
  - Internet user %
  - Billion dollars invested by a company

# False Positives

Numbers are weak entities

- Compare the number of sentences in which India and Mumbai appear together, vs the number of sentences in which India and 19 appear together.
- Just 19 can be appear with India in several contexts:
  - Internet user %
  - Billion dollars invested by a company
  - % of people below the poverty line

# False Positives

Numbers are weak entities

- Compare the number of sentences in which India and Mumbai appear together, vs the number of sentences in which India and 19 appear together.
- Just 19 can appear with India in several contexts:
  - Internet user %
  - Billion dollars invested by a company
  - % of people below the poverty line
  - date (if we are not careful)

# False Positives

Numbers are weak entities

- Compare the number of sentences in which India and Mumbai appear together, vs the number of sentences in which India and 19 appear together.
- Just 19 can be appear with India in several contexts:
  - Internet user %
  - Billion dollars invested by a company
  - % of people below the poverty line
  - date (if we are not careful)
  - number of medals won by Indian athletes...

# False Positives

Numbers are weak entities

- Compare the number of sentences in which India and Mumbai appear together, vs the number of sentences in which India and 19 appear together.
- Just 19 can be appear with India in several contexts:
  - Internet user %
  - Billion dollars invested by a company
  - % of people below the poverty line
  - date (if we are not careful)
  - number of medals won by Indian athletes...
- Can we expect the situation to be even worse for certain types of numbers?

  - Vatican City, a walled enclave within the city of Rome, with an area of approximately **44 hectares (110 acres)**, and a population of 842, is the smallest internationally recognized independent state in the world by both area and population.

# Overview of Unit Extraction System

# Overview of Unit Extraction System

- A discriminative context free grammar with scores attached to each possible production in the grammar.

# Overview of Unit Extraction System

- A discriminative context free grammar with scores attached to each possible production in the grammar.
- A production  $P$  in the grammar is of the form  $R ::= R_1 R_2$ , scored as

$$score(P) = \mathbf{w} \cdot \mathbf{f}(P, x, i, j, k),$$

where  $(i, j)$  and  $(j + 1, k)$  are text spans in  $x$  that  $R_1$  and  $R_2$  cover.

## A case for Keywords

- A large number of false matches had no reference to the relation involved.
- Eg. No mention of Population in the following matches:
  - The website of China's Ministry of Defense (MOD) has attracted around 1.25 billion visits in the three months since its opening, with the United States topping the source countries for foreign visits, website editor-in-chief Ji Guilin said.
  - Insulza, for his part, said the Organization of American States expects to raise 10 million dollars for Haiti's recovery.
  - Koloini and others brought 10 million euros, probably 15 million, back from Iraq at the time, Falter quoted from the diary.
- No reference to Co2 emission:
  - China's iron ore imports surged 41.6 percent to 627.8 million tonnes in 2009, with the value falling 17.4 percent as prices were hit by the global downturn, customs data shows.

# A case for Keywords

## Good News

Sentences expressing a numerical relation can be expected to have keywords that denote the relation

- Take all the labeled sentences, prune out sentences that don't have atleast one of the relevant keywords

Internet User %	"Internet"
Land Area	"area", "land", "land area"
Population	"Population"
Diesel	"diesel"
GDP	"Gross domestic", "GDP"
CO2	"Carbon", "Carbon Emission", "CO2"
Inflation	"Inflation", "Price Rise"
FDI	"Foreign", "FDI"
Goods Export	"goods"
Life Expectancy	"life", "life expectancy"
Electricity Production	"Electricity"

# A case for Keywords

- Numbers are the second entity in our setup ( $\text{Relation}(\text{Country}, \text{Number})$ )
- Unlike real world entities, numbers don't have an identity of their own, sentences should have words (keywords!) indicating what the number stands for
- Manual inspection of 400 sentences pruned out after applying keyword based filter backs this conjecture, not even one false negative
- The keywords are created manually, can this process be automated?
